TEC was formed in 2006 to provide consulting expertise to the power generation industry. The founders of the company collectively have over 120 years of power generation experience, and have been instrumental in bringing over 30,000 megawatts of fossil-fueled, nuclear, wood-fired, geothermal, wind and solar power on to the North American grid.

CONSTRUCTION MANAGEMENT

TEC can cover all disciplines in the field to ensure quality, maintain schedule and control costs during construction.

Construction management requires expert planning, coordination, and diligence. TEC provides this expertise. This starts with constructability reviews and is carried out to the field through construction completion, testing and turnover.

Our professionals offer expertise in all phases of construction management, and they have more successful energy projects under their belts than just about any team in the business. The result? Lower costs, lower risks and higher quality without the headaches for you.

TEC has qualified inspection personnel in the areas of Civil, Structural, Piping, Equipment, Electrical, and Instrumentation & Controls to ensure a quality installation. We also provide factory testing and inspection services.
